

## **Grill-N-Go**

### **Traffic Summary Points**

- ITE Trip Generation suggests a net decrease in trips during the PM peak hour and a net increase in trips in the AM peak hour. See attached table for comparison. This assumes a fairly high traffic generation for the existing office building.
- Traffic volume on Beaver Creek Road was 3,500 vehicles per day (vpd) in 2006. The capacity of this road would be near 10,000 vpd. See attached maps for ADT volumes.
- The heavy traffic direction on US 64 in the AM is eastbound and in the PM is westbound.
- This site is more of a lunchtime restaurant. Traffic on US 64 and Beaver Creek Road is much lower during the lunchtime hours.
- We are not requesting access on US 64. Our proposed driveway is the only placement for a driveway into our site. Driveway is located > 200 feet from the signalized intersection with US 64.
- Beaver Creek Road is developed with low-intensity traffic generators.
